

Physical Test Solutions

Innovative Solutions in Material Test Equipment

HARDNESS ACCESSORIES

To complement a complete line of Rockwell, Brinell and microhardness testers, **Physical Test Solutions (PTS)** has an extensive line of accessories for hardness testing applications. The accessories are:

Hardness Test Blocs

Hardness test blocs are vitally necessary to verify the integrity of the hardness tester being used and the credibility of the test being performed. **PTS** has an extensive range of test blocs for Rockwell, Brinell and Vickers hardness testers.

Penetrators

While in use, penetrators can become deformed or broken. **PTS** has an extensive line of diamond, steel and carbide penetrators for the most common hardness testing applications. Diamond penetrators are available for Rockwell and Vickers testers. For Rockwell tests, 1/16", 1/8", 1/4" and 1/2" ball penetrators are common. For Brinell, 10 mm penetrators are used. For many instances, master calibration kits are required. Master Calibration Kits are produced to provide customers with the ultimate tool in Quality Control. Each kit contains a test block or blocks and the actual penetrator unit that was used to calibrate them.

Anvils and Fixtures

Many hardness testing applications require the use of anvils or special fixtures. **PTS** has all of the anvils and fixtures that will be necessary to perform the hardness measuring tasks.
